I. Definition

Project Overview

[Yelp](#) is a social networking site that publishes crowd-sourced reviews about local businesses. About two years ago, Yelp challenged Machine Learning practitioners to build a model that automatically tags restaurants with multiple labels using a dataset of user-submitted photographs. The goal of this project is to develop such a model.

The competition was hosted by [Kaggle](#), a platform where data scientist use their skills to produce the best models for predicting and describing datasets uploaded by companies and users. The various datasets and inputs are accessible via the Yelp Restaurant Photo Classification competition webpage¹. Yelp provides a training dataset (234,842 photographs) and a test dataset (237,152 photographs) for this competition. Each photograph belongs to a business and the task is to predict the business attributes purely from the business photographs. There are 9 different attributes in this problem:

- good for lunch;
- good for dinner;
- takes reservations;
- outdoor seating;
- restaurant is expensive;
- has alcohol;
- has table service;
- ambience is classy;
- good for kids;

and a total of 2,000 (10,000) businesses in the training (test) dataset. Note that the datasets are quite large. Both the training and test archive files are about 7 GB.

Problem Statement

Neural networks have proven to be incredibly efficient at classifying images and often outperforms other machine learning algorithms at this task. It comes then as no surprise that neural networks are extensively used in this project. One now faces two options: i) build and train a neural network from scratch or ii) use transfer learning techniques. The properties of the dataset such as its size and complexity usually allow to make an educated decision on the type of approach to adopt. Transfer learning is used in this project for the reasons discussed in the next paragraph.
